

NMR- IRP1074 Rubber Sheet

Vibro Damping Coating (VDC) is a multilayer sandwich structure for use in submarine decks and engine rooms for suppressing the structural vibration arising from the operation of onboard machinery. The VDC is fabricated by adhering multiple layers (typically 3 layer) of rubber sheet (IRP1074) and sandwiching the multilayer rubber structure between base structure and constraining layer. The top constraining layer is applied onto the rubber layer by adhesive and the sandwich structure is bonded to the base by mechanical bolting.

3 layer VDC applied on base structure

IRP 1074 Rubber Roll

Salient Features:

- ❖ Physical appearance – Vulcanised rubber sheet with fabric impression on one side
- ❖ Size of rubber sheet – 4.1m x 800mm x 4mm thickness
- ❖ Application – by adhesive bonding
- ❖ High damping
- ❖ Good strength
- ❖ Good resistance to fuel and oil
- ❖ Can be made using conventional rubber processing machinery

Area of application:

- ❖ Submarine and ship decks and engine room floors
